

DALIBuildings 2.2.1 Release Notes

August 2019

WHAT'S NEW

PRODUCT CHANGES

This build fixes a bug addressing a customer issue where a Group disappears off the line controller after the use of Sync Device option on the NV tap of the Group.

This build also fixes a bug with the scheduled DALI tests not running after upgrading to the Microsoft SQL Server 2017.

Please note that builds (with SQL Server) after 2.2.0 will upgrade to Microsoft SQL Server 2017 and require upgrading the database. The upgrade of the database is not reversable so please make a backup of your database before upgrading.
